

## **Question: Will I Fail a Drug Test?**

For those individuals subject to random drug tests, mandated for federal employees and many private sector employees, the idea of using **CBD** can be a concern.

Drug tests usually follow **SAMHA** guidelines to keep on legal grounds. Normal drug screens are set up to only screen for one specific property in cannabis, **THC**. Regardless of the amount of **CBD** in your system when tested, you will not fail.

Although hemp sourced **CBD** products are mainly advertised as **THC** free, there can be small amounts buried inside; but most are usually non-detectable when tested. If you use upwards of 1000mg of **CBD** a day you might trigger a false positive and trigger the confirmatory **GC/MS** test which would just come back a negative. For a point of reference, most **CBD** users consume as little as 20mg to 400mg per day. Lots of common legal products can cause a false positive.

## **Why is That?**

Let's use an example ... beer. Most domestic beers contain between 4.2 and 5.5 percent ABV (alcohol by volume), yet non-alcoholic versions of beer have only around 0.4 percent ABV. There is still alcohol in non-alcoholic beer, but not enough to get you intoxicated.

This is the same in most reputable **CBD** products that can legally contain no more than 0.3 percent **THC**.

**When Used Properly: No High / No Failed Test**
